⛅ Wild Weather ☂

Welcome to Wild Weather, the best app for all your weather needs! In Wild Weather, you'll find an easy-to-use app, coded entirely in Python and using the [OpenWeather API](). The first thing you do in the app is choose your location by separately entering your city and state (only works for locations in the United States). You can then ask questions about the weather, from asking about the temperature to finding out if it's windy, and get a detailed response. At any time, you can switch your city to get weather information for another location. The app keeps letting you ask questions until you want to quit. You can quit at any time by entering "quit" or "q".

Note: While Wild Weather allows for less exact entries for the questions, it works best when question prompts are followed.
